

TP3

To avoid confusion between your work and others on the same machine, create a directory whose name is your full name and student number. Place the directory in www.

Use in this TP:

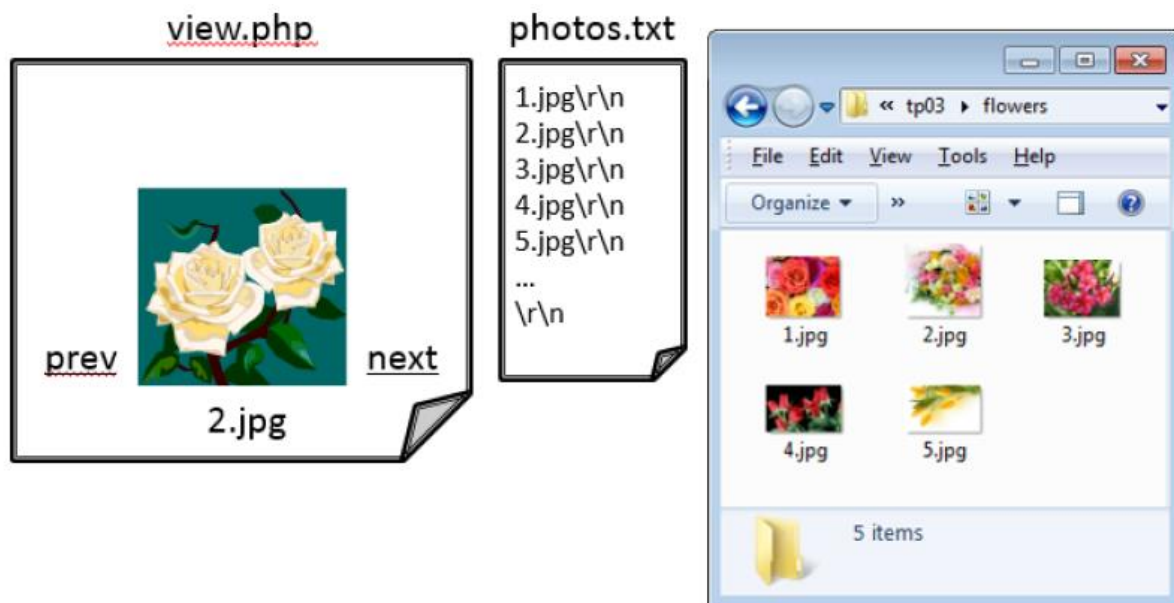

`$_GET`, `$_POST`, `fopen()`, `fwrite()`, `fgets()`, `fclose()`, `isset()`, `$_SERVER['PHP_SELF']`, `$_FILES`

The objective is to create a photo album as follows:

At first, create the “**photos.txt**” file that contains the list of photos that exist in the flowers directory.

Write the code “**view.php**” which displays the photos using two links “**prev**” and “**next**”. This file reads the photos from the text file “**photos.txt**”.

To read the photos, open the “**photos.txt**” file and read line by line.

Next, write the file “**upload.php**” which allows to deposit new photos in the folder flowers on the server.

The chosen photo is treated with the code “**save.php**”.
